

# DIGITAL SNAKE SYSTEM

**Avoid Extinction**

## THE CONTRACTOR'S OPTION

The physical installation of the cabling for a permanent sound system has reached a crossroads. For the past 50 years, the industry has been pulling miles of 291, 8451, or whatever flavor you use in code-required conduit to get the various audio signals to wherever they need to be in an installation.

Once the wire has been pulled, the soldering of XLR connectors and subsequent terminations such as panels, wall plates and floor pockets, combined with the installation of transformer-isolated microphone splitters and patch bays can take days if not weeks to finish (not to mention the trouble shooting time). This archaic method of installation costs you, and your clients a fortune, with absolutely no benefits.

Enter the age of the digital audio snake. With Momentum, sends and returns are all on CAT6 cable, capable of 256 microphone/line level inputs and virtually unlimited outputs. The Momentum network is simply CAT6 cable installed throughout the facility to as many RJ45 jacks as necessary to wire the entire building. The network uses a "star" configuration, and utilizes standard Gigabit Ethernet switches, not overpriced proprietary components.

Talk to someone on the Momentum Team at 888-253-7360. Learn about how Momentum provides possibilities, not problems.

## BENEFITS:

- » Dramatically cut costs that were previously spent on conduit, wire, plugs and labor
- » Complete more jobs in a year
- » End up with happier customers by allowing their money to be used for the audio gear they really need to pull off what the ministry wants to do
